Education

Mumbai University **July 2020 - June 2024**

BE Computer Engineering, Honors in Blockchain(CGPA of 8.07) *Mumbai, India*

Experience

Qoneqt (HQPL) **Remote**

Developer Relations Engineer *Jun 2024 – Jul 2026*

- Researched and built **ERC-20 Social Token** architecture for creator monetization, from contract design through product integration.
- Engineered **cross-chain wallet integration** using **ethers.js**, connecting **Huddle01 video infrastructure** into onboarding flows across multiple EVM chains.
- Diagnosed recurring **Web3 developer friction points** (wallet UX, SDK integration) through direct conversations, translating feedback into shipped fixes.
- Delivered technical onboarding for **2,000+ developers** across 30+ workshops in 10+ cities, teaching wallet integration and Web3 tooling hands-on.
- Managed **8 regional leads** and community support flows; produced technical content (Gitbook, developer threads) for ecosystem education.

Rheolly **Part-time**

Product Engineer *Jul 2025 – Mar 2026*

- Designed **agentic payment workflows and account abstraction patterns** for an agent-first wallet and payments infrastructure, defining failure-handling logic for autonomous transactions.
- Deployed and maintained production infrastructure (**AWS** backend, **Vercel** frontend), debugging live issues via application logs.
- Drove technical integration for early pilot customers (**ZyfAI, Vistara Labs, bond.credit, gigabrain.gg**), from scoping through production deployment.
- Worked directly with engineers on **smart account architecture and infra trade-offs**, alongside **Ethereum Foundation, Coinbase, MetaMask, Eigencloud**.

Attenomics **Part-time**

Product Engineer *Jan 2025 – Jun 2025*

- Owned end-to-end delivery of Attenomics v0, a **verifiable attention layer for tokenized social engagement**, building backend data pipelines (**Node.js**, **SQL**) and onchain verification logic.
- Deployed the product on **Vercel/AWS**, monitoring and debugging production incidents via application logs.
- Embedded with 100+ testers to debug edge cases and iterate on onchain tracking reliability under real usage.
- Scaled from 0 to 500+ users and closed **ORA Protocol** as first paying customer by shipping reliable production workflows.

Projects

Piker | *Solidity, Base, Next.js* | Demo **April 2026**

- Built an **onchain fantasy sports protocol** on **Base** with non-custodial smart contract escrow and **TEE-verified scoring**.
- Launched publicly with zero budget during IPL, generating **$150+ in real money volume** across **40+ contests**; expanded to fantasy football for the FIFA World Cup.

Erebuz | *TEE, ORAM, Railgun, Solidity* | Demo **June 2026**

- Designing a **privacy middleware SDK** that routes onchain transactions through optimal privacy pools, compliance tools, and bridges via a single call.
- Positioned as a routing layer (not a primitive) using **TEE + ORAM architecture**, capturing MEV regardless of which privacy primitive wins.
